

The following table shows the results of the regression analysis for the dependent variable "Number of children in the household" (N = 1,000). The independent variables are "Age of the head of household" and "Gender of the head of household". The table includes the coefficient estimates, standard errors, and t-statistics for each variable.

Variable	Coefficient	Standard Error	t-Statistic
Age of the head of household	0.001	0.000	1.2
Gender of the head of household	0.002	0.000	1.5
Constant	1.500	0.100	15.0

The results indicate that the number of children in the household is positively related to the age of the head of household and the gender of the head of household. The coefficient for the age variable is 0.001, and the coefficient for the gender variable is 0.002. The t-statistics for these coefficients are 1.2 and 1.5, respectively, which are not statistically significant at the conventional levels.
